

# CSC 261/461

## Database Systems

*09/10*

# NULL Values

The value NULL is used to represent:

## 1. **Unknown value.**

A person's date of birth is not known, so it is represented by NULL in the database.

## 2. **Unavailable value.**

A person has a home phone but does not want it to be listed.

## 3. **Not applicable attribute.**

An attribute LastCollegeDegree would be NULL for a person who has no college degrees because it does not apply to that person.

# Three-valued logic

**Table 7.1** Logical Connectives in Three-Valued Logic

(a)	<b>AND</b>	TRUE	FALSE	UNKNOWN
	TRUE	TRUE	FALSE	UNKNOWN
	FALSE	FALSE	FALSE	FALSE
	UNKNOWN	UNKNOWN	FALSE	UNKNOWN
(b)	<b>OR</b>	TRUE	FALSE	UNKNOWN
	TRUE	TRUE	TRUE	TRUE
	FALSE	TRUE	FALSE	UNKNOWN
	UNKNOWN	TRUE	UNKNOWN	UNKNOWN
(c)	<b>NOT</b>			
	TRUE	FALSE		
	FALSE	TRUE		
	UNKNOWN	UNKNOWN		

# Relational Model Notation

We will use the following notation:

- A relation schema  $R$  of *degree*  $n$  is denoted by  $R(A_1, A_2, \dots, A_n)$ .
- Uppercase letters  $Q, R, S$  denote relation names.
- Lowercase letters  $q, r, s$  denote relation states.
- Letters  $t, u, v$  denote tuples.

# Basic SQL

## SQL language

- Considered one of the major reasons for the commercial success of relational databases

## SQL

- The origin of SQL is relational predicate calculus called **tuple calculus** which was proposed initially as the language SQUARE.
- SQL comes from the word “SEQUEL” which was the original term used in the paper: “SEQUEL TO SQUARE” by Chamberlin and Boyce. IBM could not copyright that term, so they abbreviated to SQL and copyrighted the term SQL.
- Now popularly known as “Structured Query language”.

# SQL Data Definition, Data Types, Standards

The language has features for : Data definition, Data Manipulation, Transaction control (Transact-SQL), Indexing, Security specification (Grant and Revoke), etc.

## Terminology:

- **Table**, **row**, and **column** used for relational model terms relation, tuple, and attribute

## CREATE statement

- Main SQL command for data definition

# Schema and Catalog Concepts in SQL

The basic standard SQL syntax – there are variations in existing RDBMS systems

## SQL schema

- Identified by a **schema name**
- Includes an **authorization identifier**

## Schema elements include

- Tables, constraints, views, domains, and other constructs

Each statement in SQL ends with a **semicolon**

# Schema and Catalog Concepts in SQL (cont'd.)

## **CREATE SCHEMA** statement

```
CREATE SCHEMA COMPANY AUTHORIZATION  
'Jsmith';
```

## **Catalog**

- Named collection of schemas in an SQL environment

# The CREATE TABLE Command

Defines a new relation

- Provide name of table
- Specify attributes, their types and initial constraints
- NOT NULL (possibly)

- Can optionally specify schema:

```
CREATE TABLE COMPANY.EMPLOYEE ...
```

or

```
CREATE TABLE EMPLOYEE ...
```

# The CREATE TABLE Command

## **Base tables (base relations)**

- Relation and its tuples are actually created and stored as a file by the DBMS

## **Virtual relations (views)**

- Created through the CREATE VIEW statement. Do not correspond to any physical file.

# SQL Data Types (text)

Data type	Description
CHAR(size)	Holds a fixed length string (can contain letters, numbers, and special characters). The fixed size is specified in parenthesis. Can store up to 255 characters
VARCHAR(size)	Holds a variable length string (can contain letters, numbers, and special characters). The maximum size is specified in parenthesis. Can store up to 255 characters. <b>Note:</b> If you put a greater value than 255 it will be converted to a TEXT type
TINYTEXT	Holds a string with a maximum length of 255 characters
TEXT	Holds a string with a maximum length of 65,535 characters

# SQL Data Types (numeric)

TINYINT(size)	-128 to 127 normal. 0 to 255 UNSIGNED*. The maximum number of digits may be specified in parenthesis
SMALLINT(size)	-32768 to 32767 normal. 0 to 65535 UNSIGNED*. The maximum number of digits may be specified in parenthesis
MEDIUMINT(size)	-8388608 to 8388607 normal. 0 to 16777215 UNSIGNED*. The maximum number of digits may be specified in parenthesis
INT(size)	-2147483648 to 2147483647 normal. 0 to 4294967295 UNSIGNED*. The maximum number of digits may be specified in parenthesis
BIGINT(size)	-9223372036854775808 to 9223372036854775807 normal. 0 to 18446744073709551615 UNSIGNED*. The maximum number of digits may be specified in parenthesis
FLOAT(size,d)	A small number with a floating decimal point. The maximum number of digits may be specified in the size parameter. The maximum number of digits to the right of the decimal point is specified in the d parameter
DOUBLE(size,d)	A large number with a floating decimal point. The maximum number of digits may be specified in the size parameter. The maximum number of digits to the right of the decimal point is specified in the d parameter
DECIMAL(size,d)	A DOUBLE stored as a string , allowing for a fixed decimal point. The maximum number of digits may be specified in the size parameter. The maximum number of digits to the right of the decimal point is specified in the d parameter

# SQL Data Types (date)

DATE()	<p>A date. Format: YYYY-MM-DD</p> <p><b>Note:</b> The supported range is from '1000-01-01' to '9999-12-31'</p>
DATETIME()	<p>*A date and time combination. Format: YYYY-MM-DD HH:MI:SS</p> <p><b>Note:</b> The supported range is from '1000-01-01 00:00:00' to '9999-12-31 23:59:59'</p>
TIMESTAMP()	<p>*A timestamp. TIMESTAMP values are stored as the number of seconds since the Unix epoch ('1970-01-01 00:00:00' UTC). Format: YYYY-MM-DD HH:MI:SS</p> <p><b>Note:</b> The supported range is from '1970-01-01 00:00:01' UTC to '2038-01-09 03:14:07' UTC</p>
TIME()	<p>A time. Format: HH:MI:SS</p> <p><b>Note:</b> The supported range is from '-838:59:59' to '838:59:59'</p>
YEAR()	<p>A year in two-digit or four-digit format.</p> <p><b>Note:</b> Values allowed in four-digit format: 1901 to 2155. Values allowed in two-digit format: 70 to 69, representing years from 1970 to 2069</p>

# Example

## EMPLOYEE

Fname	Minit	Lname	<u>Ssn</u>	Bdate	Address	Sex	Salary	Super_ssn	Dno
-------	-------	-------	------------	-------	---------	-----	--------	-----------	-----

## DEPARTMENT

Dname	<u>Dnumber</u>	Mgr_ssn	Mgr_start_date
-------	----------------	---------	----------------

## DEPT\_LOCATIONS

<u>Dnumber</u>	<u>Dlocation</u>
----------------	------------------

## PROJECT

Pname	<u>Pnumber</u>	Plocation	Dnum
-------	----------------	-----------	------

## WORKS\_ON

<u>Essn</u>	<u>Pno</u>	Hours
-------------	------------	-------

## DEPENDENT

<u>Essn</u>	<u>Dependent_name</u>	Sex	Bdate	Relationship
-------------	-----------------------	-----	-------	--------------

# Example

## CREATE TABLE EMPLOYEE

( Fname	VARCHAR(15)	NOT NULL,
Minit	CHAR,	
Lname	VARCHAR(15)	NOT NULL,
Ssn	CHAR(9)	NOT NULL,
Bdate	DATE,	
Address	VARCHAR(30),	
Sex	CHAR,	
Salary	DECIMAL(10,2),	
Super_ssn	CHAR(9),	
Dno	INT	NOT NULL,

**PRIMARY KEY** (Ssn),

## CREATE TABLE DEPARTMENT

( Dname	VARCHAR(15)	NOT NULL,
Dnumber	INT	NOT NULL,
Mgr_ssn	CHAR(9)	NOT NULL,
Mgr_start_date	DATE,	

**PRIMARY KEY** (Dnumber),

**UNIQUE** (Dname),

**FOREIGN KEY** (Mgr\_ssn) **REFERENCES** EMPLOYEE(Ssn) );

## CREATE TABLE DEPT\_LOCATIONS

( Dnumber	INT	NOT NULL,
Dlocation	VARCHAR(15)	NOT NULL,

**PRIMARY KEY** (Dnumber, Dlocation),

**FOREIGN KEY** (Dnumber) **REFERENCES** DEPARTMENT(Dnumber) );

# Example

## CREATE TABLE PROJECT

( Pname	VARCHAR(15)	NOT NULL,
Pnumber	INT	NOT NULL,
Plocation	VARCHAR(15),	
Dnum	INT	NOT NULL,

**PRIMARY KEY** (Pnumber),

**UNIQUE** (Pname),

**FOREIGN KEY** (Dnum) **REFERENCES** DEPARTMENT(Dnumber) );

## CREATE TABLE WORKS\_ON

( Essn	CHAR(9)	NOT NULL,
Pno	INT	NOT NULL,
Hours	DECIMAL(3,1)	NOT NULL,

**PRIMARY KEY** (Essn, Pno),

**FOREIGN KEY** (Essn) **REFERENCES** EMPLOYEE(Ssn),

**FOREIGN KEY** (Pno) **REFERENCES** PROJECT(Pnumber) );

## CREATE TABLE DEPENDENT

( Essn	CHAR(9)	NOT NULL,
Dependent_name	VARCHAR(15)	NOT NULL,
Sex	CHAR,	
Bdate	DATE,	
Relationship	VARCHAR(8),	

**PRIMARY KEY** (Essn, Dependent\_name),

**FOREIGN KEY** (Essn) **REFERENCES** EMPLOYEE(Ssn) );

# The DROP Command

- DROP command
  - Used to drop named schema elements, such as tables, domains, or constraint
- Drop behavior options:
  - CASCADE and RESTRICT
- Example:
  - DROP SCHEMA COMPANY CASCADE;
  - This removes the schema and all its elements including tables, views, constraints, etc.

# The ALTER table command

- **Alter table actions** include:
  - Adding or dropping a column (attribute)
  - Changing a column definition
  - Adding or dropping table constraints
- **Example:**
  - `ALTER TABLE COMPANY.EMPLOYEE ADD COLUMN Job VARCHAR(12);`

# Attribute Data Types and Domains in SQL (cont'd.)

Example:

```
CREATE DOMAIN SSN_TYPE AS CHAR(9);
```

## Domain

- Name used with the attribute specification
- Makes it easier to change the data type for a domain that is used by numerous attributes
- Improves schema readability

# Questions?
